

# Choosing a Statistical Model in Biostatistics

Start at the top — identify your outcome type, then follow the arrows down.

## Before choosing a model, check these assumptions:

1. Normality — Q-Q plot, Shapiro-Wilk test, histogram of residuals
2. Homogeneity of variance — Levene's test, F-test, residual plot
3. Sample size — small n (e.g. <30)? Consider non-parametric alternatives
